Angular commands you have to know

[The complete angular course by Jannick Leismann & TutorialsEU](#)

Hi there,

As you dive deeper into Angular, you will find yourself frequently using several Angular CLI commands.

To make your life a bit easier, I've put together a quick cheat sheet of **the most commonly used commands** in Angular, along with a brief description of each.

Save this sheet for later and refer to it whenever you need a quick refresher:

```
ng new projectName
```
Creates a new Angular project with the specified project name.

```
ng serve
```
Builds the application and starts a web server to serve your application during development.

```
ng serve --open
```
or
```
ng serve -o
```
Same as ng serve, but also opens your default web browser to the application.

```
ng generate component componentName
```
or
```
ng g c componentName
```
Generates a new component with the specified name.

```
ng generate service serviceName
```
or
```
ng g s serviceName
```
Generates a new service with the specified name.

```
ng build
```
Builds your application for production, creating a dist/ folder with the output.

```
ng update
```
Checks your application for outdated dependencies, and can also update them.

Remember, these commands should be run in a terminal or command prompt from within your Angular project's root directory.

I hope you find this cheat sheet helpful as you navigate your Angular journey.

Happy coding!
